Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Jaheer is working on a health monitoring system to help individuals calculate their Body Mass Index (BMI). He has implemented a basic BMI calculator and an interface called HealthCalculator. It should have a method called calculateBMI.

You are tasked with creating a program that takes weight and height as input, calculates the BMI using the BMICalculator class, and displays the result. If the height or weight is less than or equal to zero, then return -1.

Formula: $BMI = \text{weight} / (\text{height} * \text{height})$

Input Format

The first line of input consists of a double value W, the person's weight in kilograms.

The second line consists of a double value H, the height of the person in meters.

Output Format

The output displays "BMI: " followed by a double value, representing the calculated BMI, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 70.0

175

Output: BMI: 22.86

Answer

```
import java.util.Scanner;

interface HealthCalculator{
    double calculateBMI(double weight,double height);
    /*return type must be there in calculateBMI since in the footer snippet we are
    storing its result
    in a variable and then printing -> means it must have a return type*/
}

class BMICalculator implements HealthCalculator{
    double weight;
    double height;

    BMICalculator(){ //constructor is needed, check footer snippet
        this.weight=weight;
        this.height=height;
    }

    //all methods we are taking from interfac have to be mentioned as public else
    error
    public double calculateBMI(double weight,double height){
        if(height<=0 || weight<=0){
            return -1;
        }
    }
}
```

```
        return weight/(height*height);
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double weight = scanner.nextDouble();
        double height = scanner.nextDouble();

        BMICalculator bmiCalculator = new BMICalculator();

        double bmi = bmiCalculator.calculateBMI(weight, height);

        System.out.printf("BMI: %.2f\n", bmi);

        scanner.close();
    }
}
```

Status : Correct
